1 temperature globally and at smaller scales, including in North America and California, and in the  
2 oceans. The warming signal is much larger than what could be produced by natural variability.  
3 In other words, scientists have determined that there is a causal connection between emissions of  
4 greenhouse gases and rising temperatures.

5       35. Regional warming can greatly exceed average global warming. Also, because of  
6 climate system and energy system inertias, more warming is inevitable. And emissions of the  
7 most important greenhouse gas, carbon dioxide, are still accelerating year after year.

1 Antarctica in 2005 was also found to be approximately 50 cubic miles. These observations are  
2 further evidence that global warming and sea level rise resulting from global warming are
